Class 08: Breast Cancer Mini Project

Farnam Tavakoli (PID:A17628539)

Before we get stuck into project work we will have a quick look at applying PCA to some example RNAseq data (tail end of lab 7)

```
url2 <- "https://tinyurl.com/expression-CSV"</pre>
  rna.data <- read.csv(url2, row.names=1)</pre>
  head(rna.data)

```

Q1. How many genes are in this dataset?

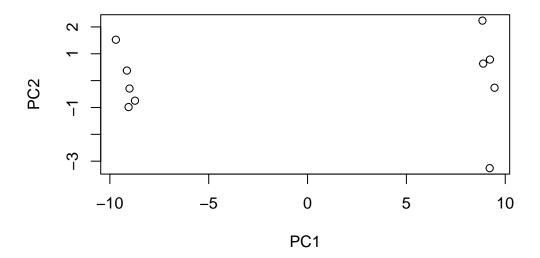

```
nrow(rna.data)
```

[1] 100

Run PCA

```
## Again we have to take the transpose of our data
pca <- prcomp(t(rna.data), scale=TRUE)

## Simple un polished plot of pc1 and pc2
plot(pca$x[,1], pca$x[,2], xlab="PC1", ylab="PC2")</pre>
```

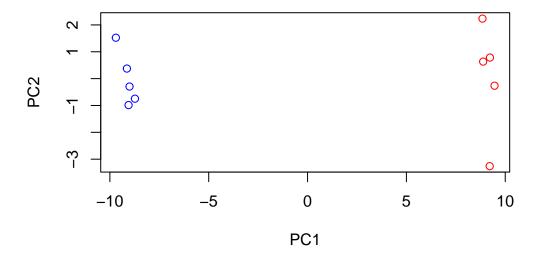

summary(pca)

```
Importance of components:

```

Analysis of Breast Cancer FNA data.

The data itself comes from the Wisconsin Breast Cancer Diagnostic Data Set.

Values in this data set describe characteristics of the cell nuclei present in digitized images of a fine needle aspiration (FNA) of a breast mass.

First we will read the data:

```
wisc.df <- read.csv("WisconsinCancer.csv", row.names=1)
head(wisc.df)

diagnosis radius_mean texture_mean perimeter_mean area_mean
842302 M 17.99 10.38 122.80 1001.0</pre>
```

Note that the first column here wisc.df\$diagnosis is a pathologist provided expert diagnosis.

```
diagnosis <- as.factor(wisc.df$diagnosis)</pre>
```

Now I want to make sure I remove that column from my data set for analysis.

```
wisc.data <- wisc.df[,-1]
head(wisc.data)</pre>
```

How many patients?

```
nrow(wisc.df)
```

[1] 569

Q1. How many observations are in this dataset?

```
ncol(wisc.data)

[1] 30

Q2. How many of the observations have a malignant diagnosis?

table(wisc.df$diagnosis)

B M
357 212

Q3. How many variables/features in the data are suffixed with _mean?

length(grep("_mean", colnames(wisc.data)))
```

Principal Component Analysis

[1] 10

Here we will use prcomp() on the wisc.data object - the one without the diagnosis column.

First, we have to decide wether to use the scale=TRUE arhument shen we run prcomp().

We can look at the means and sd of each column. If they are similar then we are all good to go. If not we should use Scale=TRUE)

```
colMeans(wisc.data)
```

Q4. From your results, what proportion of the original variance is captured by the first principal components (PC1)?

44.27%

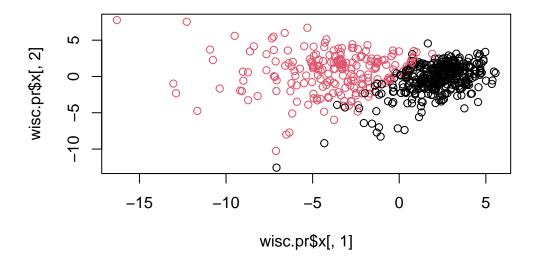

- Q5. How many principal components (PCs) are required to describe at least 70% of the original variance in the data?
- 3 PCs capture 72.6% of the original variance.
 - Q6. How many principal components (PCs) are required to describe at least 90% of the original variance in the data?
- 7 PCs capture 91.0% of the original variance.
 - Q7. What stands out to you about this plot? Is it easy or difficult to understand? Why?

Plotting the PCA results

```
# biplot(wisc.pr)
```

We need to make our own plot.

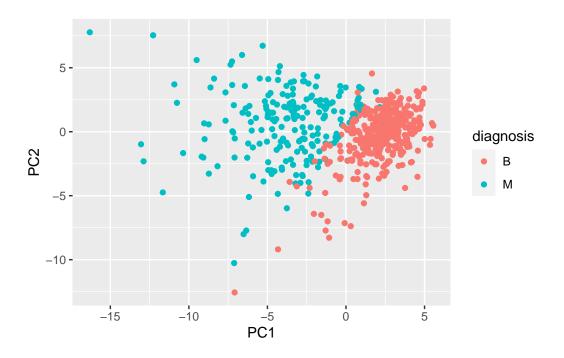

plot(wisc.pr\$x[,1], wisc.pr\$x[,2], col=diagnosis)

```
library(ggplot2)

pc <- as.data.frame(wisc.pr$x)

ggplot(pc) +
   aes(PC1, PC2, col=diagnosis) +
   geom_point()</pre>
```

Communicating PCA resutls

Q9. For the first principal component, what is the component of the loading vector (i.e. wisc.pr\$rotation[,1]) for the feature concave.points_mean?

```
wisc.pr$rotation["concave.points_mean",1]
```

[1] -0.2608538

Q10. What is the minimum number of principal components required to explain 80% of the variance of the data?

```
tbl <- summary(wisc.pr)
which(tbl$importance[3,] > 0.8)[1]
```

PC5

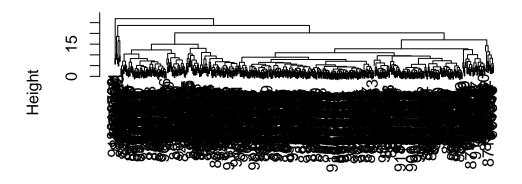

5

Hierarchical Clustering

The main function for hierarchical clustering is called hclust() it takes a distance matrix as input

```
d <- dist( scale(wisc.data))
wisc.hclust <- hclust(d)
plot(wisc.hclust)</pre>
```

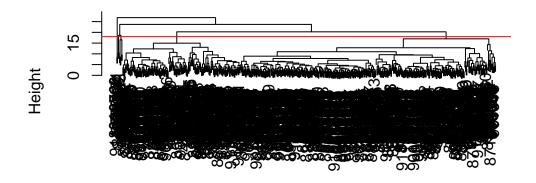

Cluster Dendrogram

d hclust (*, "complete")

```
plot(wisc.hclust)
abline(h=18, col="red")
```

Cluster Dendrogram

d hclust (*, "complete")

Come back here. Later to see how our cluster grps correspond to M or B groups.

```
ggplot(pc) +
  aes(PC1, PC2, col=diagnosis) +
  geom_point()
```

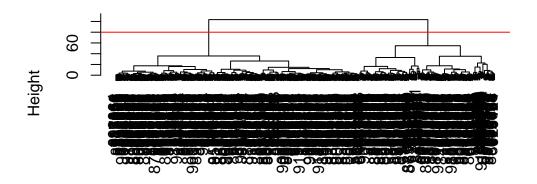

5. Combining Methods

Here we will perform clustering on our PCA results rather than the original data.

In other words we will clustering using wis.pr\$x - our new better variables or PCs. We can choose s many or as few PCs to us as we like. It is your call!

```
d.pc <- dist(wisc.pr$x[, 1:3])
wisc.pr.hclust <- hclust(d.pc, method="ward.D2")
plot(wisc.pr.hclust)
abline(h=80, col="red")</pre>
```

Cluster Dendrogram

d.pc hclust (*, "ward.D2")

We can use table() function to make a cross-table as well as just a count table.

```
table(diagnosis)

diagnosis
    B    M
357 212

table(grps, diagnosis)

    diagnosis
grps    B    M
```

```
1 24 179
2 333 33
```

Write a note here about how to read this cross-table results. The results indicate that our cluster 1 mostly captures cancer (M) and our cluster 2 mostly captures healthy (B) samples/individuals.

7. Prediction

```
#url <- "new_samples.csv"</pre>
  url <- "https://tinyurl.com/new-samples-CSV"</pre>
  new <- read.csv(url)</pre>
  npc <- predict(wisc.pr, newdata=new)</pre>
  npc
           PC1
                                PC3
                                            PC4
                                                      PC5
